Test report

Email and text sending is functional on its own through the IDE. Here's proof from my phone. It can't be tested easily. You would have to rewrite the receiver code so that it doesn't ask the database for email and phone but you put it in yourself.

Socket server is functional and sending and receiving json objects. Same for the extension, the socket client in the extension can send and receive json objects functionally.

Product tracking is also functional, it can scrape the websites of products that are on a user's wishlist.

These are all functional on their own through the ide however the whole project is unfinished and the UserDao is unfinished.
